Maximum Marks	4 Marks

Empathy Map

Create an empathy map to understand your customer/user from four perspectives - what they Say, Think, Do, and Feel - in relation to the problem your project addresses. This helps the team build a customer-centric solution.

<u>SAYS</u> • "Legacy forecasting metrics don't give us enough actionable warning time before localized flash floods." • "We need an integrated portal to track diverse parameters like cloud visibility and precipitation instantly." • "It's challenging to map real-time evacuation paths without a predictive platform."	<u>THINKS</u> • How can machine learning models like XGBoost turn historical weather records into instant risk signals? • Will a centralized Flask web dashboard make it simpler to monitor multiple districts concurrently? • We must achieve high model accuracy to trust these automation tools during severe monsoons.
DISASTER MANAGEMENT OFFICER (Role / User Type)	
<u>DOES</u> • Reviews regional precipitation charts and manually compiles historical weather datasets from multiple endpoints. • Coordinates emergency response plans, safety briefs, and resource allocation routes across flood-prone locations. • Tests analytical pipelines against actual field observations to verify early warning thresholds.	<u>FEELS</u> • Anxious about late warning alerts that leave communities with zero window to respond safely. • Overwhelmed by checking fragmented weather metrics manually during rapid rainfall escalations. • Optimistic about deploying smart web tools on robust cloud setups like IBM Cloud to safeguard lives.
